【Special Feature】 EU CBAM Full Implementation: Changing Competitive Environment and Responses by Countries and Companies

The EU Carbon Border Adjustment Mechanism (CBAM) entered full operation in January 2026. Starting from 2026, imported products subject to CBAM from outside the EU will incur carbon pricing costs in line with the EU Emissions Trading System (EU ETS) applied within the EU, requiring Japanese companies to take measures. The introduction of carbon pricing costs may impact Japanese companies' price competitiveness and supply chains through efforts to reduce greenhouse gas (GHG) emissions and choices in calculation and reporting methods. Similar mechanism implementations are also being considered in the UK and Asian countries. This special feature introduces the latest CBAM developments and corporate response status, while exploring impacts on global supply chains and competitive environments.

<Special Feature Articles> *Additional articles will be added in the future.

◇Full implementation of EU CBAM; GHG quantification and management impact costs and competitiveness

◇EU CBAM: Practical response to emissions calculation

◇New phase in CBAM compliance for Japanese companies

【Special Feature】 Transforming Global Semiconductor Ecosystem <Additional Articles>

Semiconductor ecosystems are showing active movements globally. In preparation for the semiconductor market reaching \$1 trillion by 2030, chipmakers and related companies are accelerating investments at an unprecedented scale. Major countries are entering a phase of channeling massive budgets to attract investments to companies. With new elements such as economic security and geopolitics, signs of change are emerging in corporate behavior, including industry-government-academia collaboration for supply chains and R&D. Based on on-site interviews with policymakers, experts, and business leaders in various countries and regions, future prospects are examined.

◇Current Status of Tohoku Semiconductor Ecosystem (Part 1) Expansion of Human Resource Development Infrastructure

【Africa: Morocco】

Morocco's automotive market achieves record high sales of 235,372 vehicles in 2025

Morocco's 2025 new vehicle sales (passenger cars and light commercial vehicles) set a record high. Market expansion factors include stable vehicle prices, improved financing conditions, and increased commercial vehicle demand from tourism expansion.

Additionally, increased demand for electric vehicles contributed to market expansion. In September 2025, the country's first exhibition specialized in hybrid electric vehicles (HEV) and electric vehicles (EV), "Auto Expo 2025," was held, contributing to increased awareness and promotion of EV technology. Furthermore, Renault and Stellantis are expanding production capacity and R&D functions in the country, enhancing its presence as an automotive production and export hub.

【Africa: South Africa】

South Africa's new vehicle sales reach 10-year high in 2025

According to the National Association of Automobile Manufacturers of South Africa (NAAMSA), South Africa's 2025 new vehicle sales (total of passenger cars and commercial vehicles) were 597,338 units, a 15.7% increase from the previous year. This surpassed pre-COVID 2019 sales (536,486 units) for the first time and reached a 10-year high since 2015 (617,650 units). Sales increase factors include improved macroeconomic conditions, interest rate reductions, low inflation, moderated new vehicle price increases, and widespread adoption of low-priced vehicles imported from China and India.

【Europe: Netherlands】

2025 new vehicle sales show modest growth; electrification advances through tax and environmental measures

The Netherlands' 2025 passenger car new registrations reached 388,024 units, a 1.7% increase from the previous year. Year-end rush demand ahead of the narrowing of electric vehicle (EV) corporate vehicle tax incentives resulted in market performance exceeding industry forecasts. Meanwhile, the commercial vehicle market saw significant sales declines due to tax measures and rebound effects before zero-emission zone implementation. By brand, Kia maintained the top position for the second consecutive year, while Skoda, which introduced new EVs, rose significantly in rankings.

【Asia: Taiwan/Japan】 Japan-Taiwan collaboration at the frontline of "remote unmanned logistics"

Social implementation of ultra-long-distance remote forklifts

Against the backdrop of expanding global trade and increased manufacturing production volumes, logistics demand is rising, while labor shortages have become a serious challenge in logistics operations. In particular, in harsh work environments such as outdoor work in extreme heat or cold and inside frozen warehouses, recruitment of new personnel proves difficult. Labor shortages for workers handling "variable-position cargo operations" such as loading and unloading cargo from trucks to warehouses is also a challenge. As one countermeasure to address these issues, the logistics industry is turning to automation technologies such as robotics.
